Pipeline Watch: 15 Approvals And 16 Phase III Trial Updates

by **Scrip Team**

Pipeline Watch is a weekly snapshot of selected late-stage clinical trial events and approvals announced by pharmaceutical and biotech companies at medical and industry conferences, in financial and company presentations, and in company releases and statements.

The table above records the past week's major events that occurred in the late-stage pipeline during the past week (see table for relevant dates), created using Informa Pharma Intelligence's [Biomedtracker](#).

The table lists drugs at Phase II or above for which an important catalyst was recorded during the week, according to catalyst type, including clinical results, trial starts and approvals. Make use of the tabs, scroll button and search function to see each section.

Hyperlinks in the table take subscribers to the relevant event section of Biomedtracker where more details can be found, and to articles on the *Scrip* website where the event in question is explored and analyzed.

The change to Biomedtracker's Likelihood of Approval (LOA) metric, and the new LOA, are also included as a percentage for products where available. The LOA is based on Biomedtracker's view of the historical progress of drugs developed within a particular disease sector, combined with an opinion of its analysts.

A companion resource, the *Pink Sheet*'s regulatory-focused [*FDA Performance Tracker*](#), follows regulatory milestones such as marketing submissions, approvals, user fee dates and complete response letters.
